The sequence given is the insert of the intermediate plasmid pwDR996.

DMDR996 was constructed to carry genomic DNA encoding amino acid (AA) and the sequence but as constructed to a human kappa light chain ie. the light chain on acid (AA) to 108-AA214 of a human placental genomic DNA was prepared and cleaved with EcoR1 to give a 2.5 kb fragment. This fragment comprising the with EcoR1 to give a 2.5 kb fragment. This fragment comprising the kappa chain constant region was cloned into the EcoR1 site of puC8 to give pAB8. The DNA encoding LC was amplified from pAB8 using the primer sequences given in AAQ30194-15. The 1240 bp reaction product was ligated into EcoRV linearised pNN03 (see AAQ30565) that had been dephosphorylated. This generated plasmid pSAB153 (see AAQ30916). LC was amplified from pSAB153 using the primers given in AAQ30915 and AAQ30917 to generate an approx. 1276 bp fragment. This fragment was igated to EcoRV linearised pNN03 that had been dephosphorylated by the presence of a 1122 bp Ecol009 I restriction fragment. E. Coli GA22(14) to ampliciallin resistance. Plasmid pMNB986 was cled to transform E. Coli GA22(14) to ampliciallin resistance. Plasmid pMNB986 was used to transform E. Coli GA229, which does not methylate its own DNA. Sequence analysis of pMDR986 showed that a cloning artifact caused a NorI site 3' of the constant region to be been to replaced with a Pvul site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     24 TICTAAACTCTGAGGGGTCGGATGACGTGGCCATTCTTTGCCTAAAGCATTGGTTTAC

The sequence given is the insert from the intermediate plasmid pSAB153.

This plasmid was used in the construction of the intermediate plasmid pNAB986 (see AAQ30918). pWDR986 was constructed to carry genomic DNA encoding amino acid (AA) 108-AA214 of a human kappa light chain ie.

The light chain constant region (LC). Human placental genomic DNA was prepared and cleaved with ECORI to give a 2.5 kb fragment. This fragment comprains the kappa chain constant region was cloned into the ECORI site of pUCB to give pAB8. The DNA encoding LC was amplified from pAB8 using the primer sequences given in AAQ30914-15. The 1240 bp treation product was ligated into ECORY linearised plasmid pSAB153. LC was amplified from pSAB153 using the primers given in AAQ30915 and that had been dephosphorylated in This generated plasmid pSAB153. LC was amplified from pSAB153 using the primers given in AAQ30915 and caphosphorylated by calf alkaline phosphatase. The ligation mixture was used to transform E. coli JA221(Iq) to ampicillin resistance. Classic products and identified by the presence of a 1122 bp Eco0109 I restriction fragment. pWDR986 was used to transform E. coli JA221(Iq) to ampicillin resistance. Coli GN2929, which does not methylate its own DNA. Sequence analysis of pMDR986 was constant product at a cloning artifact caused a Not1 site 3' of the constant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               435 TTCTAAACTCTGAGGGGGTCGGATGACGTGGCCATTCTTTGCCTAAAGCATTGAGTTTAC

Transgenic animal; human heterologous antibody; transgene; isotype switching; neutrophil efflux; reperfusion injury; Log binding; actoimmune reaction; inflammatory response; transplant rejection; acid induced lung injury; acute adult respiratory distress syndrome; ARDS; vasculitis; septic shock; allergic reaction; asthma; oystic fibroais; ss.

Example 42; Pages 310-312; 452pp; English.

The present sequence represents the kappa light chain plasmid, pCK7-96, which includes the kappa constant region and polyademylation site. The plasmid is used in the construction of miniganes for expression of igdkappa anti-CD4 antibodies, in the transgenic mouse of the invention. Igdkappa anti-CD4 antibodies, in the transgenic mouse of the invention. The specification describes transgenic non-human animals, especially a mouse, which are capable of producing a human heterologous antibodies of multiple isotypes by undergoing isotype switching. The transgenic animals of functionally rearranging at heterologous diversity (D) gene in a heavy chain transgene comprising at least one V, D and J gene segment, and one constant region gene segment. The immunoglobulin (Ig) light chain transgene comprises at least one V, D and J gene segment, and one constant region gene segment. The immunoglobulin (Ig) light chain region gene segment are not constant region gene segment are not constant region gene segment are not constant region and so be used to prevent efflux of neutrophils from animal. The antibodies are used to reduce undesirable autoimmune reactions, inflammatory responses and reduce itssue damage and prolong survival in animal models of acute adult respiratory discress syndrome (ARDS) and antimal models of acute adult respiratory discress syndrome (ARDS) and and induced lung influxy. The anti-IL-8 antibodies can also be used for the treatment of vasculitis, septic shock, allergic reactions

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (1g) having an affility constant (Ka) of at least 2 multiply the constant of the constant constant region and polyadenylation site. The which includes the kappa constant region and polyadenylation site. CD4 antibodies may be used in therapeutic and diagnostic applications, activity of CD4 cells and reduce undesirable autoimmune reactions, inflammatory response and transplant rejection. Transgenic animals are capable of producing heterologous antibodies of multiple isotypes by undergoing isotype switching. These animals produce a first Ig type that is necessary for antigen-stimulated B-cell maturation and can switch to encode and produce one or more subsequent heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    an immunoglobulin

The specification describes transgenic animals that are capable of producing a heterologous antibody. The antibodies are isolated form a hybridoma, comprising B cells, that is obtained from a transgene mouse having a genome comprising a human heavy chain transgene and a human light chain transgene. The B cells are fused to immortalized cells suitable for generating a hybridoma, which produces a detectable amount of an immunoglobulin that specifically binds digoxin or Shinga-like toxin. B cells from transgenic animals can be used to generate hybridomas expressing monoclonal high affinity human sequence antibodies. Antibodies produced from the transgenic animals of the invention can be used to treat human diseases, cancer, infectious disease, transplant rejection, blood diseases, cancer, infection disorders and other diseases. The present sequence is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TACTTAAACACCATCCTGTTTGCTTTCTTTCCTCAGGAACTGTGGCTGCACCATCTGTTTT

The present invention relates to novel transgenic nonhuman mammals, particularly rodents, comprising two human immunoglobulin (1g) loci, where one of two the human immunoglobulin loci is a human heavy chain locus and the other locus is a human light chain locus, and where one of the loci is of a transchromosome. The transgenic animals are useful for generating a number of B-cell expressing human antibody sequences. They are also useful for producing rearranged immunoglobulin sequences, producing human antibody display libraries, and generating a human sequence antibody that binds to a predetermined antigen. The produced antibodies are useful for treating immune related disorders. The present sequence represents a plasmid used in the

These two sequences are not identical; AAQ55004 comprising 7059 bases and AAQ52611 comprising 8400 bases. Fig 10 should consist of and AAQ52611 comprising 8400 bases. Fig 10 should consist of pages 1/4, 2/4, 3/4 and 4/4), however, page 2/4 is duplicated and page 4/4 is missing. The sequence found in AAQ62611 represents pages 1/4 - 3/4.

A humanised monoclonal antibody corresponding to the murine anti-CD18 antibody 603 was prepared. The variable (V) region sequences from both the heavy (H) and light (I) chains were determined from cDNA (amplified by PCR), and spliced onto human constant (C) regions.

C camplified by PCR), and spliced onto human constant (C) regions.

C camplifing in a chimeric 60.3 Ab (1991, Kappa). The chimeric Ab was expressed in tissue culture (Ag8.653 mouse myeloma cells, detected CO by ELICBA), and examined in binding assays. The results from the Adverse competition and inhibition assays showed that the chimeric Ab was as effective as the murine 60.3 Ab. The deduced murine VH and VL protein sequences were selected to be used as and two human Ig protein sequences were selected to be used as and two human Ig protein sequences. Based on the 60.3 Fv wondel and the two human template sequences. Based on the 60.3 Fv wondel and the two competition and and the form the protein data base, and two humanised Fv was modeled. Construction of the humanised CC (spanning the entire V region) to form the VH and VL These were again compensed that the humanised Ab (1901, kappa). The humanised proteins were again competition a dozen the humanised dolls and seaved for It he humanised for It he humanised CC About a dozen of the humanised dolls and seaved for It he humanised for It he humanised cells expressing Olls and assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5156

Sequence 31, Application US/09227595
Patent No. 6444792
GENERAL INFORMATION:
APPLICAMT: Gray, Gary, Gary S. et al.
TITLE OF INVENTION: CTLA4-Immunoglobulin Fusion Proteins
TITLE OF INVENTION: Having Modified Effector Functions and Uses INVENTER OF SEQUENCES: A STREET OF SEQUENCES: LAHIVE & COCKFIELD
STREET: 60 State Street, suite 510
CLTY: BOSTON
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match 55.7%; Score 1091.2; DB 4; Length 1708; Best Local Similarity 99.6%; Pred. No. 1.4e-274; Matches 1115; Conservative 0; Mismatches 3; Indels 2;
